## Exercise Sheet 5

## Exercise 1 (Interrupts)

1. What are interrupts?
2. What is the interrupt vector?
3. What are exceptions?
4. What happens, if during the handling of an interrupt, an additional interrupt occurs?

## Exercise 2 (Scheduling Strategies)

1. Why exists a system idle process in some operating systems?
2. Explain the difference between preemptive and non-preemptive scheduling.

Prof. Dr. Oliver Hahm
Operating Systems (WS 23/24)

Faculty of Computer Science and Engineering Frankfurt University of Applied Sciences
3. Name one drawback of preemptive scheduling.
4. Name one drawback of non-preemptive scheduling.
5. How does multilevel feedback scheduling work?
6. Which scheduling strategies are fair?

A scheduling method is fair when each process gets the CPU assigned at some point.Priority-driven scheduling
$\square$ Shortest Remaining Time FirstFirst Come First ServedLongest Remaining Time FirstLast Come First ServedRound Robin with time quantumShortest Job FirstHighest Response Ratio NextLongest Job FirstEarliest Deadline First
7. Which scheduling strategies can operate preemptive?First Come First ServedLongest Remaining Time FirstShortest Job FirstRound Robin with time quantumLongest Job FirstStatic multilevel schedulingShortest Remaining Time FirstMultilevel feedback scheduling
8. Which scheduling strategies require an estimation of the CPU runtime (= execution time)?Priority-driven schedulingShortest Remaining Time FirstFirst Come First ServedLast Come First ServedLongest Remaining Time FirstShortest Job FirstRound Robin with time quantumLongest Job FirstHighest Response Ratio Next
on JobEarliest Deadline First

## Exercise 3 (Scheduling)

| Process | CPU time | Priority |
| :---: | ---: | ---: |
| A | 5 ms | 4 |
| B | 10 ms | 15 |
| C | 3 ms | 12 |
| D | 6 ms | 5 |
| E | 8 ms | 7 |

Five processes shall be processed on a single CPU/core system. All processes are at time point 0 in state ready and created in the given order. High priorities are characterized by smaller values.

Draw the execution order of the processes with a Gantt chart (timeline) for Round Robin (time quantum $q=1 \mathrm{~ms}$ ), FCFS, SJF, and priority-driven scheduling.

The Priority column in the table is only relevant for the priority-driven scheduling and not for Round Robin or FCFS.

Calculate the average runtimes and average waiting times of the processes.

The CPU time is the time that the process needs to access the CPU to complete its execution. Runtime $=$ lifetime $=$ time period between the creation and the termination of a process $=(\mathrm{CPU}$ time + waiting time $)$.

Prof. Dr. Oliver Hahm Operating Systems (WS 23/24)

Faculty of Computer Science and Engineering Frankfurt University of Applied Sciences

| Runtime | A | B | C | D | E |
| :--- | :---: | :---: | :---: | :---: | :---: |
| RR |  |  |  |  |  |
| FCFS |  |  |  |  |  |
| SJF |  |  |  |  |  |
| Priority-driven scheduling |  |  |  |  |  |

Waiting time $=$ time of a process being in state ready. Waiting time $=$ runtime CPU time.

| Waiting time | A | B | C | D | E |
| :--- | :---: | :---: | :---: | :---: | :---: |
| RR |  |  |  |  |  |
| FCFS |  |  |  |  |  |
| SJF |  |  |  |  |  |
| Priority-driven scheduling |  |  |  |  |  |

## Exercise 4 (Shell Scripts)

1. Program a shell script, which requests the user to select one of the four basic arithmetic operations. After selecting a basic arithmetic operation, the user is requested to enter two operands. Both operands are combined with each other via the previously selected basic arithmetic operation and the result is printed out in the following form:
```
<Operand1> <Operator> <Operand2> = <Result>
```

2. Modify the shell script from subtask 1 in a way that for each basic arithmetic operation a separate function exists. These functions should be relocated into an external function library and used for the calculations.

Prof. Dr. Oliver Hahm Operating Systems (WS 23/24)

Faculty of Computer Science and Engineering Frankfurt University of Applied Sciences
3. Program a shell script, which prints out a certain number of random numbers up to a certain maximum value. After starting the shell script, it should interactively query the values of these parameters:

- Maximum value, which must be in the number range from 10 to 32767 .
- Desired number of random numbers.

4. Program a shell script, which creates the following empty files:
```
image0000.jpg, image0001.jpg, image0002.jpg, ..., image9999.jpg
```

5. Program a shell script, which renames the files from subtask 4 according to this scheme:

OS_Exercise_<YEAR>_<MONTH>_<DAY>_0000.jpg
OS_Exercise_<YEAR>_<MONTH>_<DAY>_0001.jpg
OS_Exercise_<YEAR>_<MONTH>_<DAY>_0002.jpg
OS_Exercise_<YEAR>_<MONTH>_<DAY>_9999.jpg
